

# Burst Alert Telescope (BAT) Flight Operations

Scott Barthelmy  
NASA-GSFC

# Burst Alert Telescope

# BAT Instrument Parameters

- **Energy Range** 15 - 150 keV
- **Field of View** 2 Steradian, partially coded
- **Spatial Resolution** 17' sky pixel, centroided to 4' position information
- **Spectral Resolution** 7 keV FWHM, average
- **Sensitivity** 0.2 photons/cm<sup>2</sup>/sec
- **Timing Accuracy** 250 usec (knowledge; end-2-end)
- **Timing Resolution** 100 usec
- **Max Flux (BBOY)** 200,000 Counts/sec (entire array)
- **Position Notice** 5', on the ground by T+20 sec

# Observing Plan

- BAT staring at sky waiting for a burst or transient
    - XRT & UVOT observing previous bursts
  - Rate & Image Triggers initiate the burst response
    - SC slews to new burst position (if safe)
    - XRT & UVOT begin a series of standard observations
  - BAT Hard X-ray survey while waiting for a burst
    - Longer timescale transients ( $\geq$ few hrs) found in ground analysis
  - Daily Galactic Plane scans
  - Weekly “all sky” coverage (100%)
  - For now, BAT will random walk across the sky
- } After T+1yr

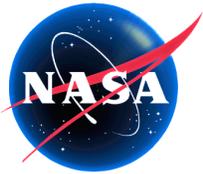

# BAT Observing Sequence

- Stare mode waiting for a rate-increase trigger
  - Calculate the sky image, Scan for a peak, Find the position, Compare to on-board catalog
- Sends position to the FOM, Calculate the Merit, Request a slew, S/C checks observing constraints (safety), Slew to the new burst position.
- Position (& other messages) also sent to TDRSS/GCN
- All events are recorded: Prior to slew (~3 min), during slew (20-70 sec), and after slew (~6 min).
- Lightcurve is recorded (even during the slew)
  - So bursts longer than 20 sec will have full lightcurves
- After the slew, 1-min & 5-min sky images are made
  - Hard x-ray afterglow is expected for 0 to ~10 min

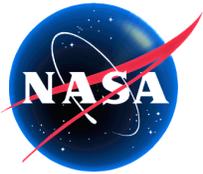

# Other On-Orbit Operations

- Periodic e-pulsar calibration cycles (gain and offset)
  - Done during non-burst slews (ie Pre-Planned Target slews)
- Monitoring/disabling for Noisy and Dead detectors
- All burst data & survey data into SSR
- TLM downlinks 5-8 passes per day (Malindi)
- Command uplinks (Malindi and occasionally TDRSS)
  - Instrument maintenance commands, and TOO target commands
- MOC is 8/5 with auto-paging for emergencies

# Ground Ops Supporting Effort *Swift*

- Checking the Trigger criteria performance
  - Adjusting the criteria parameters
- Checking the offset, gain, linearity, and threshold variations
  - Can do a better job than the flight s/w can
  - Trending
  - Command uploads generated
- Checking the housekeeping
  - Rates, Temperatures, CZT Bias currents, Voltages, Currents, etc
- Checking the Mask-to-Detector alignment
  - Uploading adjustment parameters
- Quick-look analysis of the Survey data for Transients and TOO generation

# Burst Triggering

- Fast Rate triggers: 4, 8, 16, 32, 64 msec
- Slow Rate triggers: 64, 128, 256, 512, 1024 msec, and 2, 4, 8, 16, 32, 64 sec
- In many E-bands, and in 9 geographic regions
- Pre- & Post-trigger background subtraction intervals selectable
- Background det rate map is subtracted to eliminate steady-state sources (so only the burst should be present in the image).
- If image does not produce a significant point source, then scanning for higher-significance triggers continues and a new image is calculated & scanned for a point source (every 7 sec).
- Image Triggers: 1 min, 5 min, & "Pointing\_Obs" min
  - These are not background-subtracted
  - Scanned for point source and compared to on-board catalog

# BAT Data Products

- Data Products: TDRSS (T+<seconds>)
  - Burst Alert, Timestamp (1 sec)
  - Burst positions, 5 arcmin (Ack or Nack) (7-8 sec, 15, 22, ...)
  - FOM decision (Ack or Nack) (8 sec)
  - Slew decision (Ack or Nack) (8 sec)
  - Light curve of burst (and during slew as well) (150 sec)
  - Scaled map (counts in all dets, 1 E-bin, of the trigger interval, good & bad triggers)
- Data Products: Malindi Downlink (0-7 hrs plus ~2 hrs)
  - Pre- & post-history of burst (10 min of event-by-event)
    - Masked weighted for the burst position; energy corrected.
  - 1-min & 5-min, 80-channel images until occultation
  - Burst spectra (including slew) on various timescales
  - Response matrices (same timescales as burst spectra)
  - Lightcurves, slew-corrected
  - Sky images (will include steady-state sources in the BAT FOV)
  - Pulsar light curves (on-board folding)

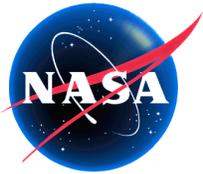

# BAT Data Dissemination

- Rapid dissemination of burst data to the world via GCN & WWW
  - Positions, Lightcurves, Spectra, Images
- All data to everyone, immediately (seconds, minutes, hours)
- There are pre-arranged follow-up teams
  - coordinated by Kevin Hurley (UCB).
- “Burst Advocates” will answer all immediate, burst-specific questions about the importance of “this burst”.
- Swift can respond, via uploaded ToO, to GRBs and other transients detected by other instruments.

# Ground Compliments Swift

- Swift follow-up will not be a complete nor comprehensive set of observations:
  - Won't slew to all burst; ~15% missed
    - And ~10% will have a delayed slew (due to observing constraints)
  - Won't have 100% coverage due to orbital occultations
    - This is significant for the early-time portion of the Afterglow
  - Won't have 100% time-coverage due to overlapping targets
  - Follow-up observation terminated by sensitivity limits
  - Won't cover all energy bands (eg R, IR, radio)
  - No polarization
  - No high-resolution spectroscopy
  - No TeV, gravity waves, or neutrino

# Activation Plan

ft

- Day 4
  - Turn on IP-Prime
  - Turn on PCB
- Day 5
  - Turn on 1st DM of 1st Block
  - Turn on HV
  - Start mapping bkg and SAA
- Day 6
  - Turn on 2-7 more DMs & HV
  - Enable triggers (no FOM)
- Days 7
  - Turn on 2nd Block
- Day 8
  - Turn on a few more Blocks
- Day 9
  - Turn on a few more Blocks
- Day 10
  - Turn on remaining Blocks
- Day 11+
  - Start on-orbit calibrations
    - Crab Mask/FOV mapping
    - Cygnus trigger tests
- Day TBD
  - Enable FOM
- Day ~45
  - Begin ~normal ops

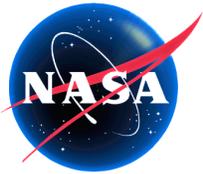

## Burst Distribution Schedule:

<45 day Any special gold-plated bursts will be manually sent to the GCN.

46-135 Moving towards the automatic distribution by the GCN.

>135 All bursts distributed through GCN automatically.

# GCN Circulars

| Item                   | Value / Comment   |
|------------------------|---|
| Website                | <a href="http://gcn.gsfc.nasa.gov/gcn">gcn.gsfc.nasa.gov/gcn</a><br>There will be a "Swift" page/table (like all the other missions). |
| Number of readers      | 710. There will be a step-increase when Swift is launched.  |
| Cost                   | Free  |
| Sign-up/Register       | Yes, but most of you are already signed up.   |

# Burst Data Products Example

# BAT Burst Tools

- 
- 
- `tdrss2fits` - convert TDRSS packets to FITS files
  - `batbinevt` - bin up evt-by-evt data in time and energy
  - `batmaskwtevt` - calc mask weighting factor for each event
  - `bateconvert` - convert raw pulse height into true energy
  - `batbayesblock` - break up a lightcurve into baysian blocks
  - `batdrmgen` - generate the DRM for a burst position
  - `xspec` - enhanced with BAT-specific features
  - `batfftimage` - calc an FFT image for the burst
  - `batevt2dpi` - make a Det Plane Image from evt-by-evt data
  - `batdph2dpi` - make a Det Plane Image from Det Plane Histogram

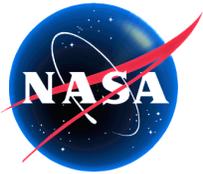

# BAT Flight Software

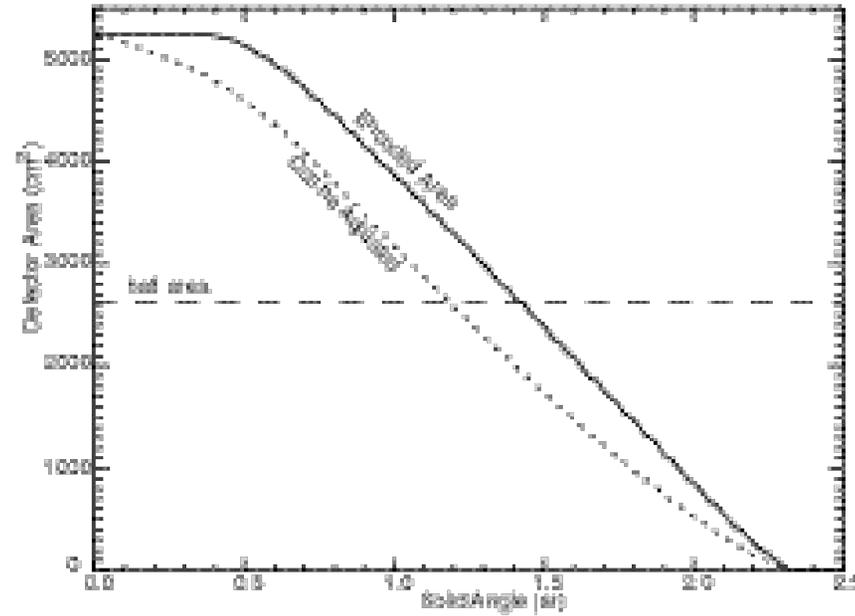

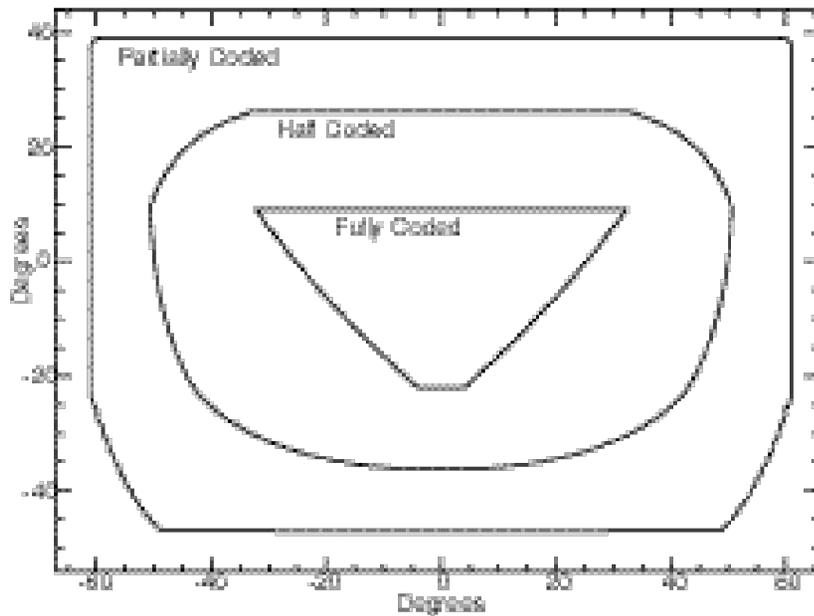

- Software resides in both the RAD6000 & DSP
- Divided into two parts: 1) Engineering, 2) Science
- Software does:
  - Command, control, HK, telemetry
  - Ingest/sort/unpack data from Detector Array
  - Monitor event rates to detect GRB's (rate triggers)
  - Produce images to locate GRB's when triggered
  - Notify FOM and GCN (via TDRSS) when GRB is detected
  - Collect Survey data; Monitor for transients (image triggers)
- Includes the FOM s/w
  - It decides: "Is this latest burst important?"

# BAT FOV and Solid Angle

# Detector Array

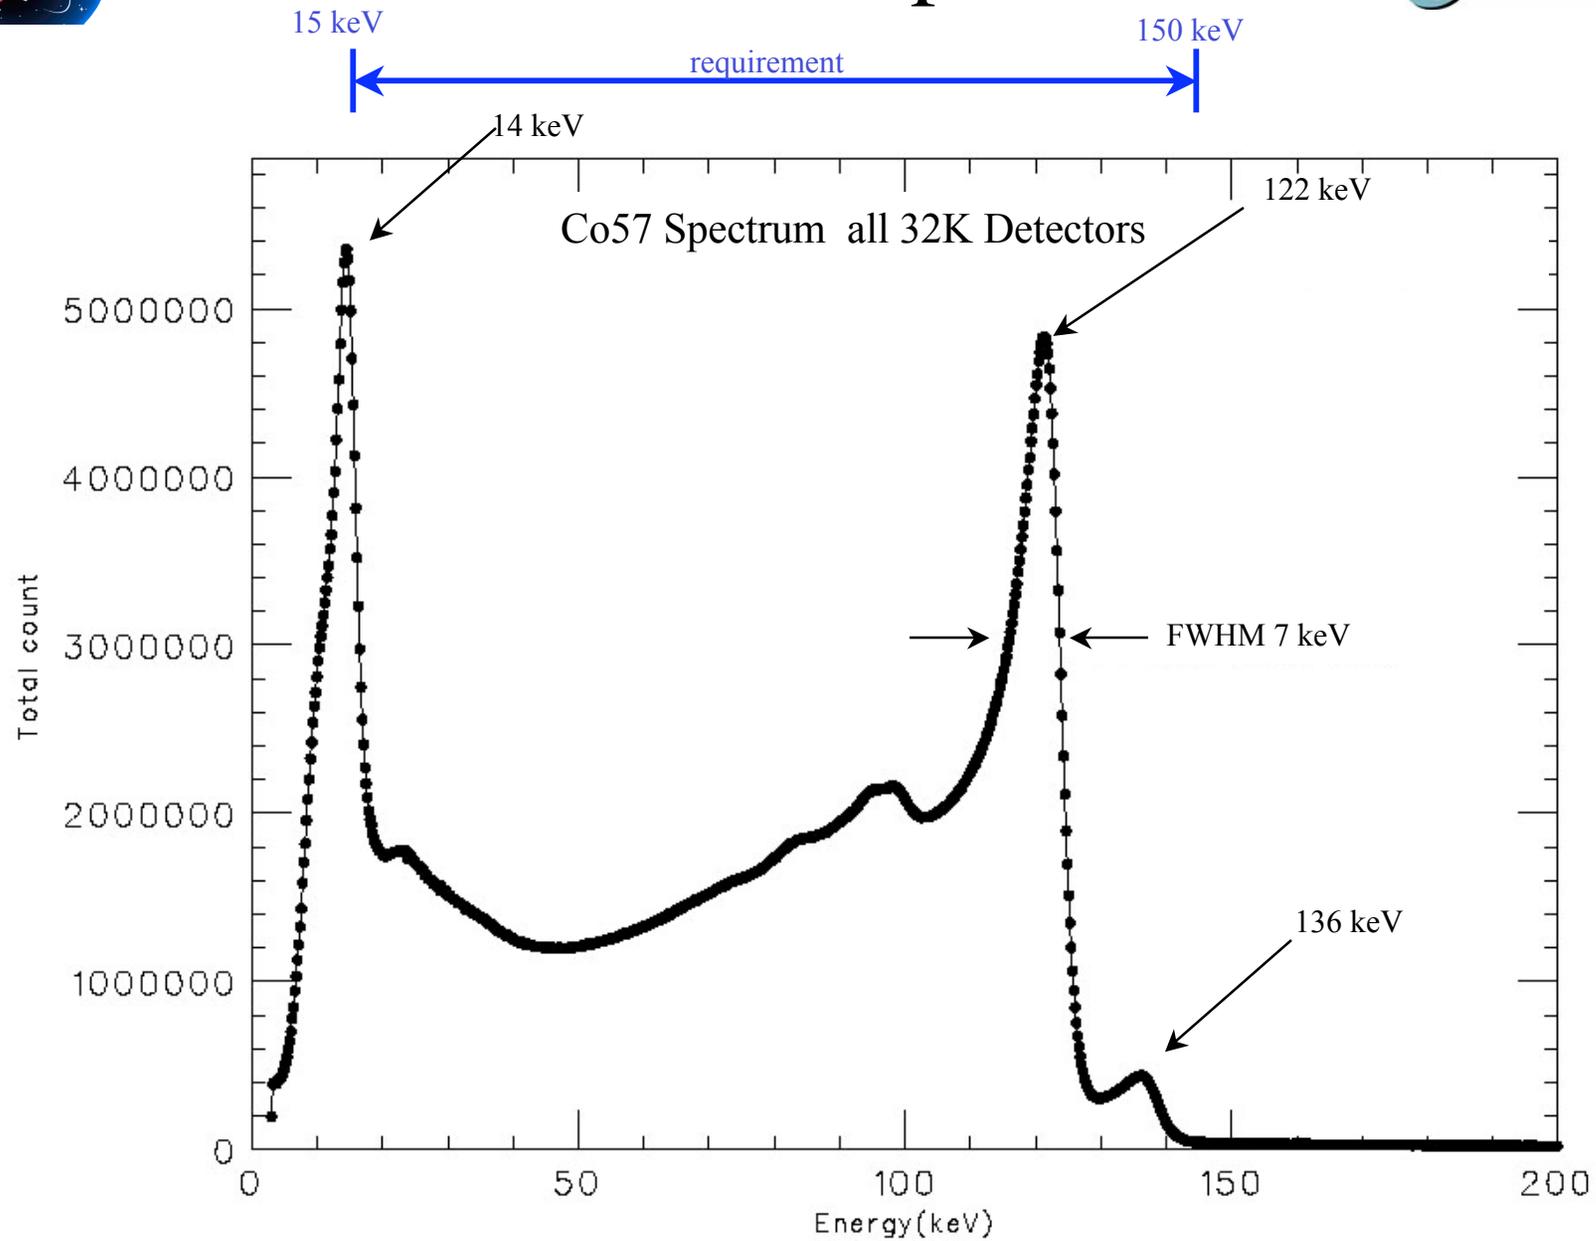

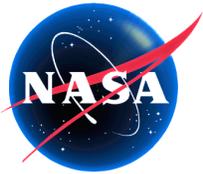

- The array consists of
  - 16 Blocks, each with 8 DMs, each with 2 Sandwiches, each with 128 dets ( $16 \times 8 \times 2 \times 128 = 32,768$ ) (5200 cm<sup>2</sup>)
  - Each Block has a BCDH card, a BVR card, an XA1VR card, a Filter Box, a Heater Controller, and DM Heaters
  - Individual detectors can be disabled (expect 2-3% disabled due to noisy behavior)
  - Individual Sandwiches, DMs, even Blocks can be disabled; BAT will still produce a burst position! (Coded aperture technique is very forgiving of “holes” in the detector array.)
  - Threshold commandable at the Sandwich-level: 0 to ~200 keV
    - Expect to run the array with a 12-13 keV threshold
  - Energy quantization is ~1/4 keV
  - Bias voltage commandable: 0 to -300v (expect to use -200v)
    - Leakage currents in the 200-800 nA/Sandwich @-200v @20°C
  - E-pulser to calibrate the gain, offset, & INL of each of the 32K channels
  - TaggedSource (Am241) provides absolute E-scale & Effective Area calibration

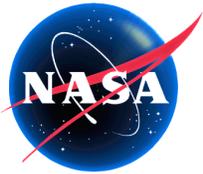

# Combined Spectrum

# BAT Flight Mask (52,000 Lead Tiles)

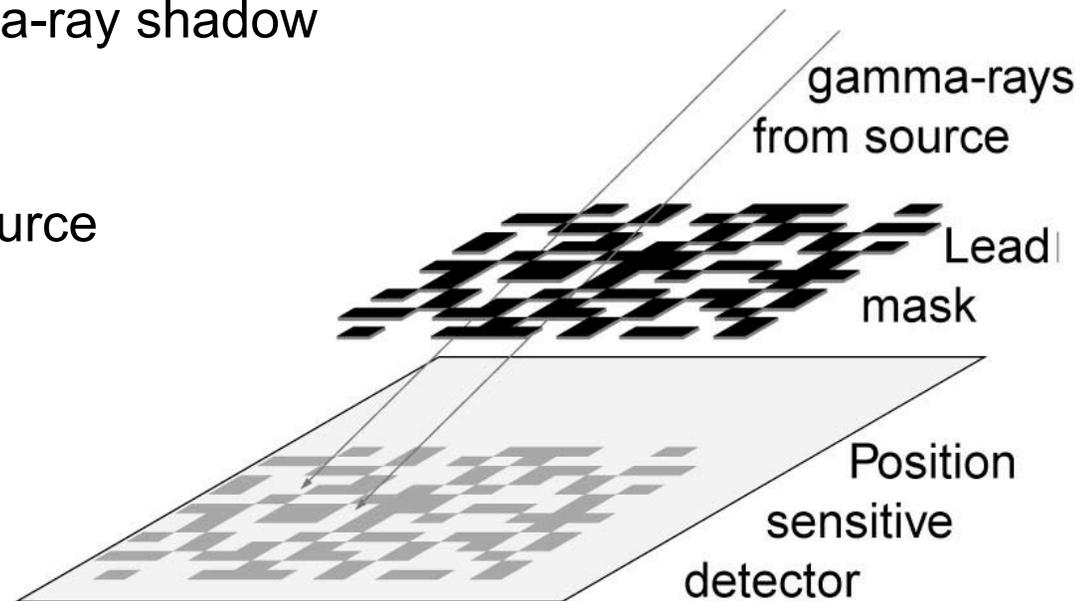

# Coded Aperture Imaging

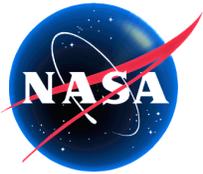

- Source casts gamma-ray shadow on detector
- Location of shadow yields location of source

- Calculation of shadow location is computer-intensive:
  - FFT, Convolve with mask Pattern,  $\text{FFT}^{-1}$
  - Scan for peak, Compare to on-board catalog
  - Send position of “new” source to RAD6000 and FOM
  - 7 seconds

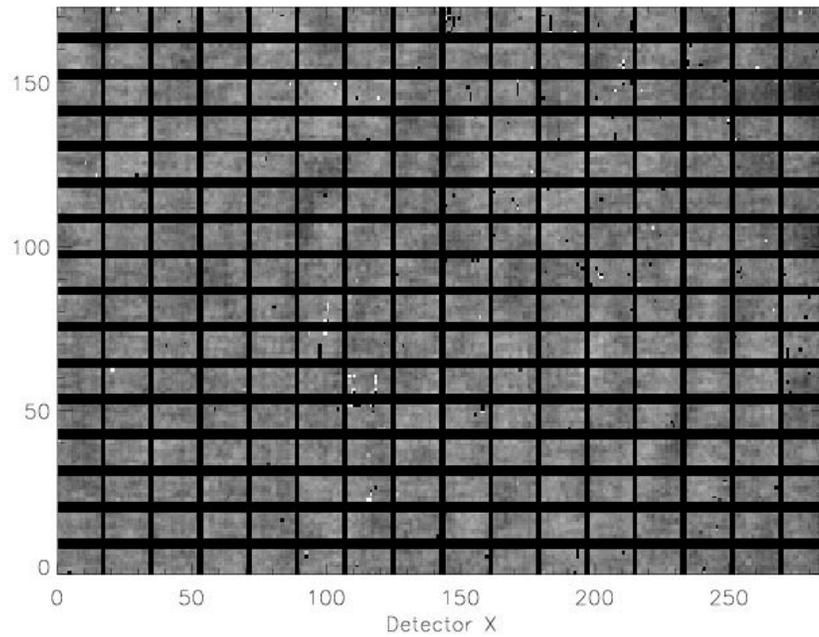

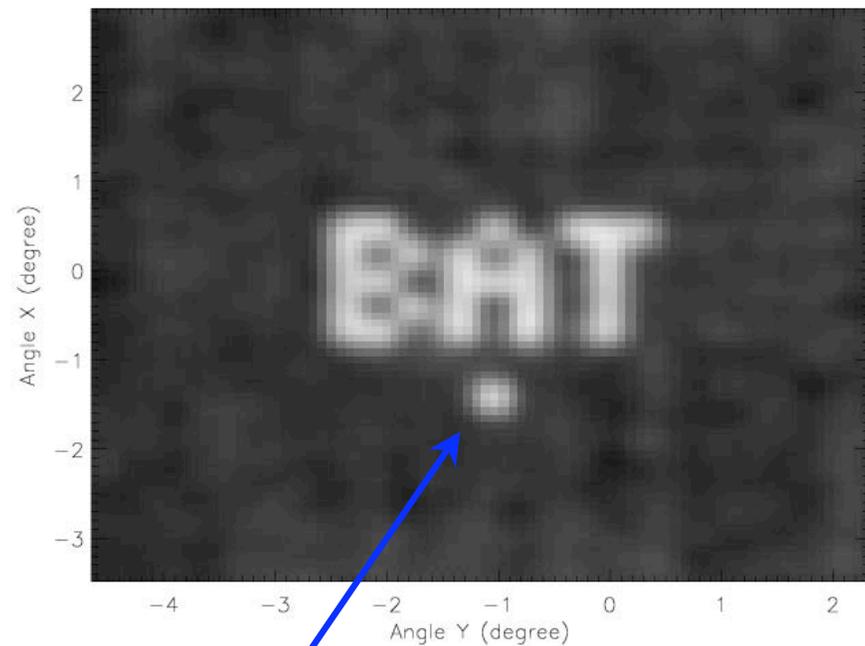

# Coded Aperture Before and After

Raw Detector Rate Map

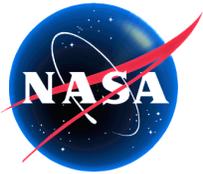

Sky Image, after FFT, Mask Convolution, InvFFT

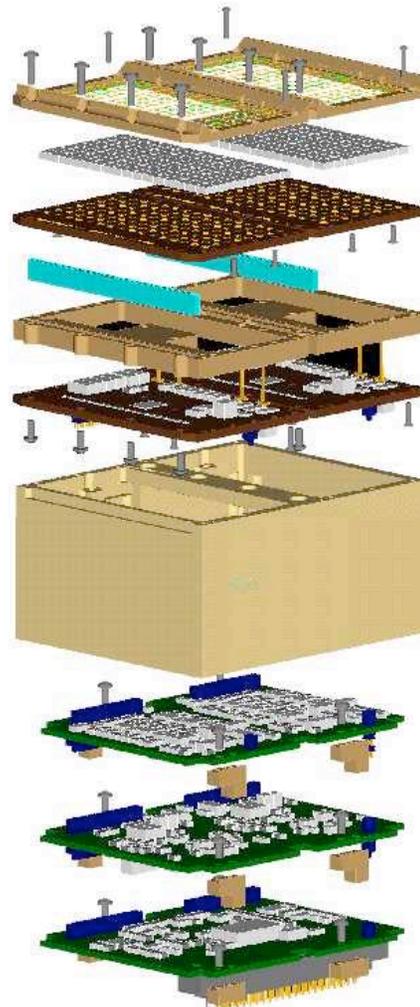

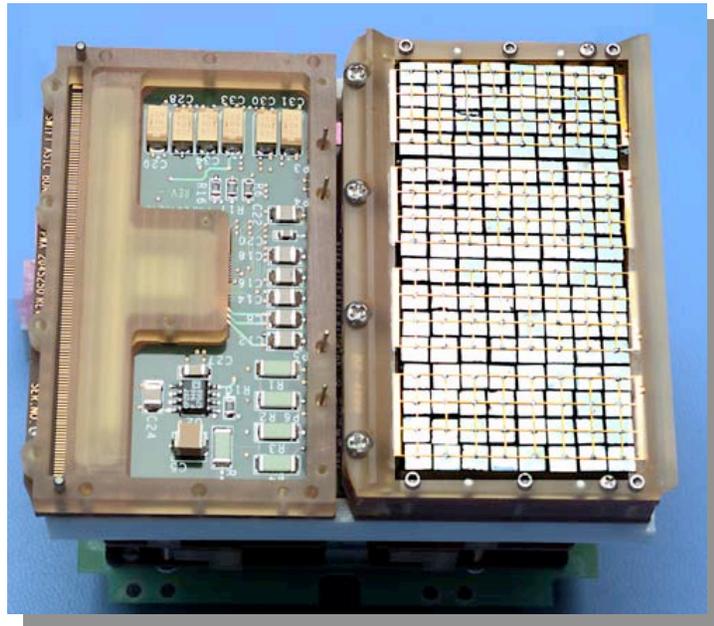

PSF is 17 arcmin; Centroided to 1 arcmin

# Detector Module

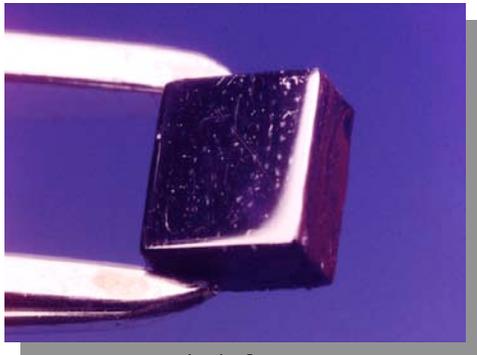

- Dual EMI frame & HV grids
- Dual 16x8 CZT detector arrays
- Dual R&C detector boards
- Dual Elastomeric connectors
- Dual ASIC frames
- Dual ASIC boards

DM housing

Analog board

Mixed-signal board

Digital board

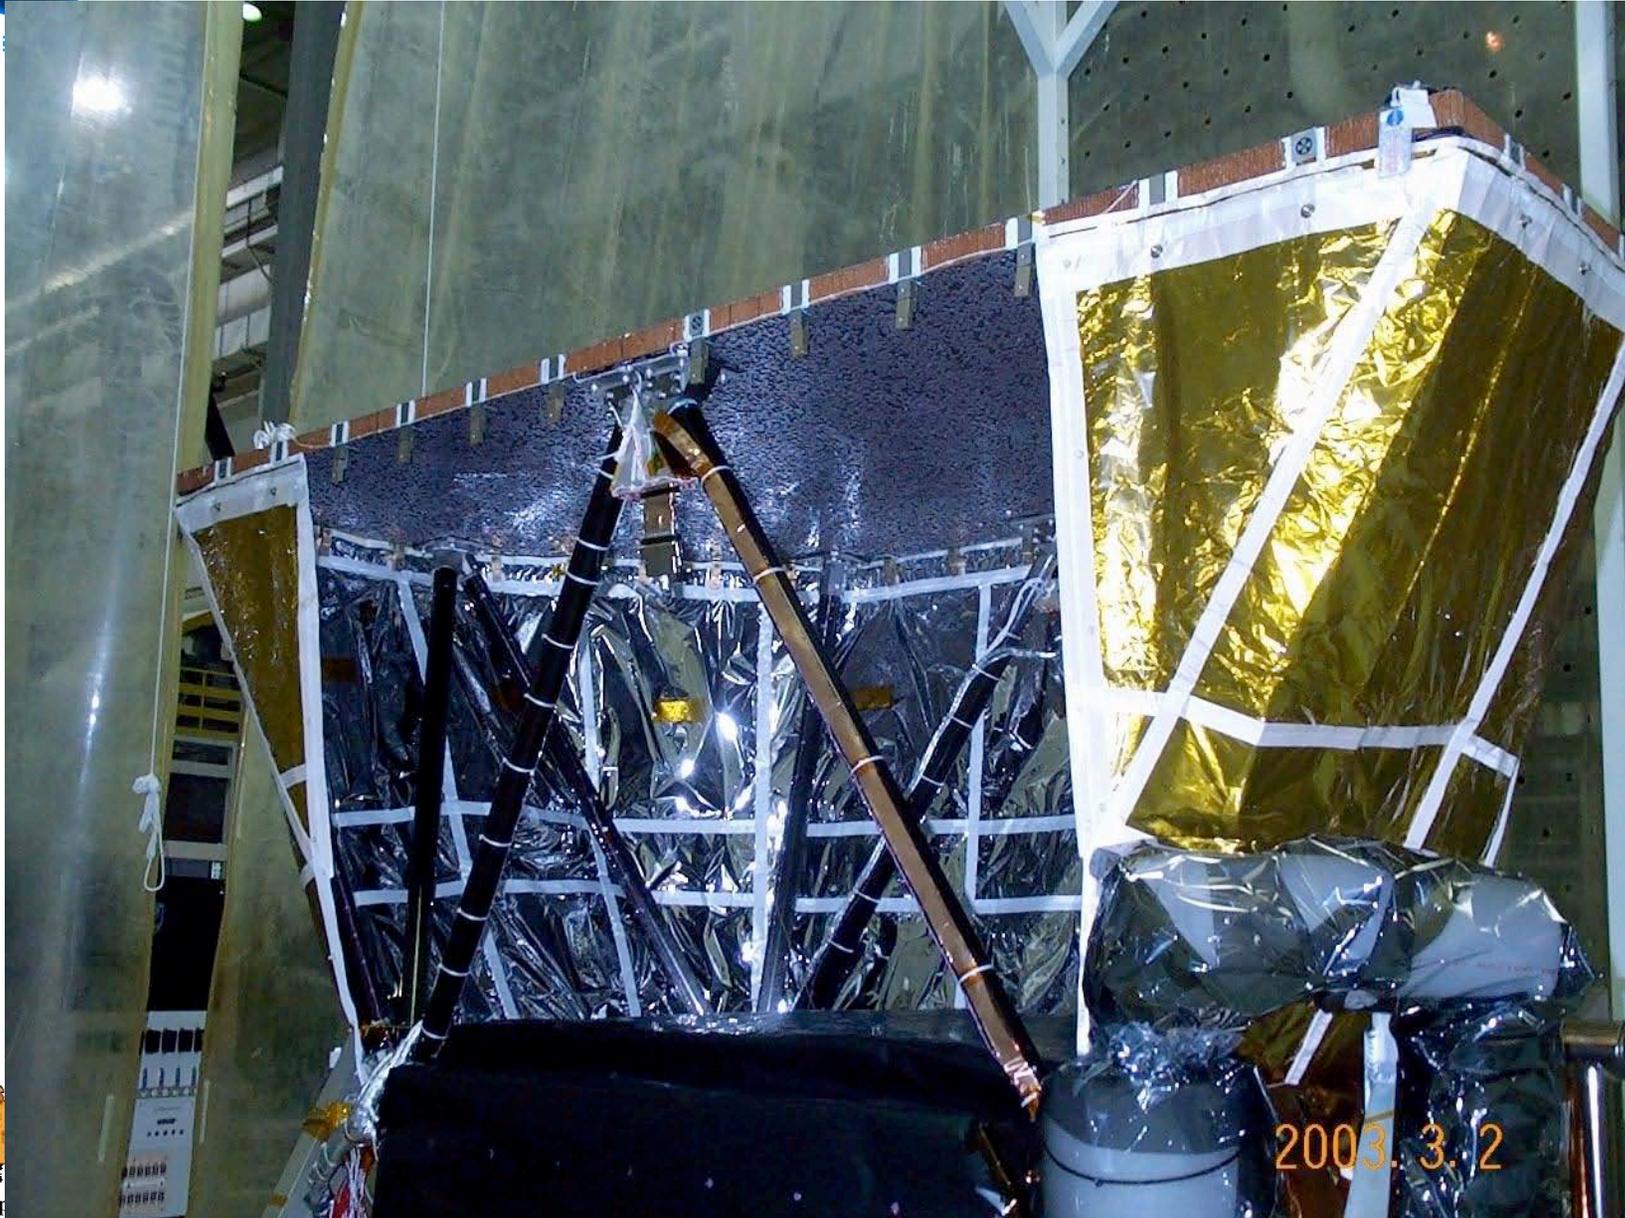

4x4x2 mm

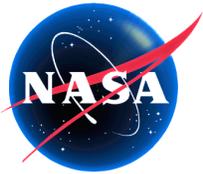

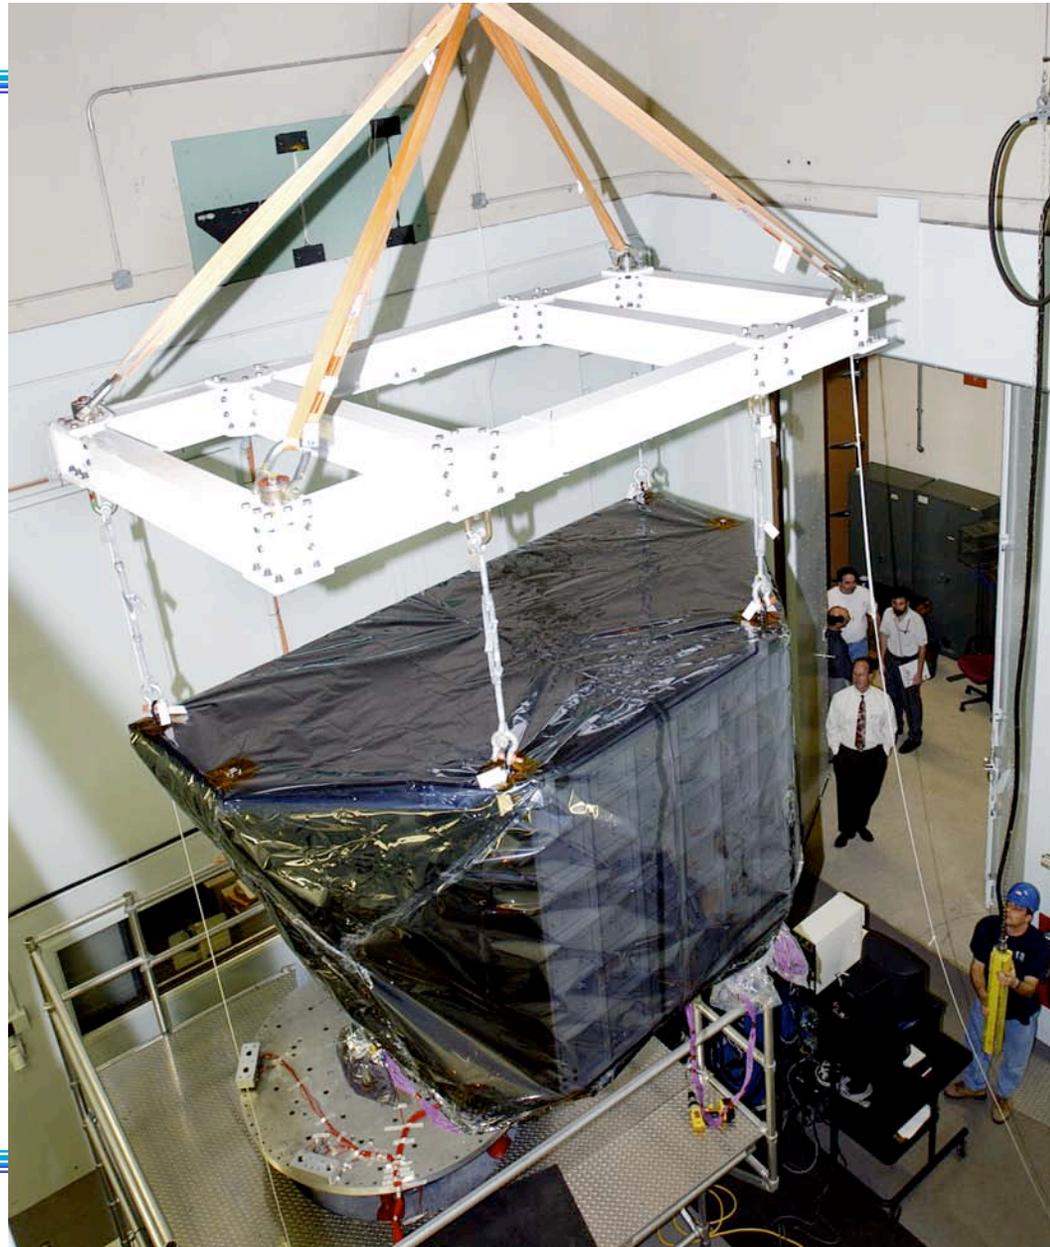

With the Backside of Fringe Shield Removed

*Swift*

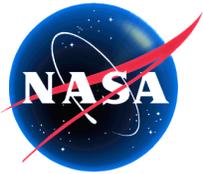

# BAT into Vib Cell

Goddard Space Flight Center

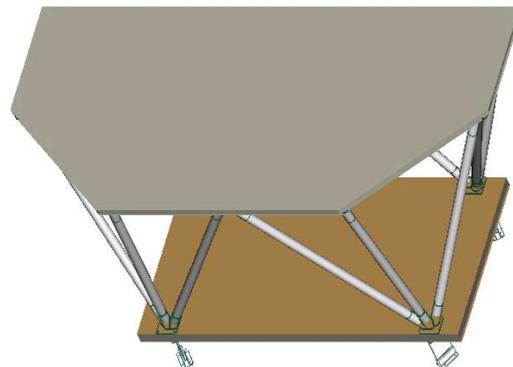

# BAT Structural System

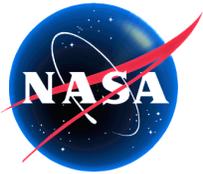

- The BAT Structural System
  - Consists of:
    - Mask Substrate
    - Mask Support Structure (struts)
    - Detector Array Plate (DAP)
    - Graded-Z Shield
    - Flexures

Puli installing flight Fringe Shield for fit-check.
